List of Functions not Working Correctly

-Uploading a file crashes/refreshes the page on the first time. Must attempt to upload a file twice in order to successfully add it

-Location: Unknown

-Solution for removal of fault: Unknown

-Downloading a file causes the Ethereum Contract recipient address to be a “new contract” rather than the wallet address of the owner of the file. Rejecting the first contract and attempting to purchase the file on the second download fixes the issue

-Location: Unknown

-Solution for removal of fault: Unknown

-After purchase, you are provided with 2 links, which are the receipt and download link. Only open the transaction receipt in a NEW TAB. don't just click it. The bug is simply that if you were to open it directly, then press back, it will no longer become visible.

-Location: function display_download()

-Solution: Store user receipts as an extra field to user accounts
